TITLE: Machine for hot scalping of ingots

PERIODICAL: Wiadomości hutnicze, no. 12, 1960, 376-380

TEXT: The article describes the machine used for hot scalping of ingots, produced by the Italian Plant "Innocenti". Such a machine, popularly referred to as "thermal milling machine", is being installed at the slabbing mill of the "Warszawa" Metallurgical Plant, the first plant in Poland to have such a machine. The machine cleans the ingot surface after the ingot has been heated to a temperature of 1,200°C. The advantages of this surface-cleaning machine are: 1) greater economy during processing; 2) elimination of cracks which may occur after the ingot has been cooled; 3) elimination of the annealing process and 4) reduction of the processing time. The machine which does not differ essentially from the cold-scalping machine, consists of headstock; feeding platform; manipulator; control board

Card 1/2

Machine for hot scalping of ingots

and shavings-collecting equipment. The cutting head which has a diameter of 1,500 mm, has 48 cutters and a speed of 75 rpm. The cutters are made of carbon steel. One single person can operate the whole complex machine, which has a considerable number of hydraulically-operated parts. The machine can process on the average about 10 to 13 ingots per hour. It comes in three versions: 1) for 1-ton ingots the "FCL/1" model; 2) for 3-ton ingots, the "FCL/3" model and for 5-ton ingots, the "FCL/5" model. There are 4 photos and 2 figures.

POL/43-59-11/12-14/33

AUTHOR: Tylusiński, Mirosław, Master of Engineering

TITLE: Flame Cleansing of Rolling Mill Materials by Machine

PERIODICAL: Wiadomości hutnicze, 1959, Nr 11-12, pp 372-378  
(Poland)

ABSTRACT: The article describes machines in common use for cleaning of rolling mill materials in the USA, Germany and the Soviet Union. Such machines were first built in America before WW II and were imported to Europe by the Germans who made one important innovation, namely that it was more economical to flame cleanse the raw ingot instead of the rolled product as the Americans originally did. Fig 1 shows a multi-burner machine developed by the German Messer firm. In this case the ingot remains motionless while the machine travels on rails parallel to the ingot. Fig 2 shows how the speed of cleansing with this machine depends on the thickness of the surface layer being removed from the ingot. The ✓

Card 1/4

POL/43-59-11/12-14/33

Flame Cleansing of Rolling Mill Materials by Machine

Messer machine is fed with 99.4% pure oxygen and the fuel is gas from the coking plant. All setting controls are electric and there is also an emergency pneumatic control system. German technicians have calculated that the minimum profitable rate of work of this machine is 1,000-1,500 tons per month, while the machine's maximum processing capacity is 6-12,000 tons per month, depending on the transport system used in conjunction with the operation. The author stresses at this point that certain types of steel and alloys must be pre-heated before flame-cleansing. A machine used for flame cleansing of pre-heated ingots is shown in Fig 5. The German firm Griesheim has elaborated the pre-heating requirements of various alloys, according to their chemical composition, and the results are shown in Table 2. The author also mentions that flame cleansing methods are widely in use in the Soviet Union and are generally the same as those employed in the West. He also notes that there is now a tendency

Card 2/4

POL/43-59-11/12-14/33

Flame Cleansing of Rolling Mill Materials by Machine

to cleanse the ingots while hot, immediately after being taken out of the ingot moulds. One may therefore expect a number of new solutions in this field. The article concludes with a description of similar machines produced in the US by Union Carbide. He stresses that not all details of these machines are known since they are guarded for patent purposes, but they are automated to a high degree and very efficient. Figs 6 and 7 show tuyere-equipped head pieces used on the Union Carbide machines. The interesting points about the American machine are that it uses acetylene and very pure oxygen and that the gases are mixed in the flame itself, thus eliminating back-flashes. Another important point is that the surface layer removed in the process contains about 70% Fe and is recovered for further use. In conclusion, the author stresses that flame-cleansing is one of the conditions of obtaining high-quality rolled products. Even though

Card 3/4

Flame Cleansing of Rolling Mill Materials by Machine

POL/43-59-11/12-14/33

the American type machines which work in the axis of rolling of the rolling mill are highly efficient, it is doubtful whether they could be introduced in Poland since Polish plants are obsolete and do not possess oxygen supplies are high quality fuel. American machines should be planned in conjunction with new plants, while in the older plants German machines could be used. There are 5 photographs, 2 tables, 1 diagram and 5 references, 1 of which is Soviet and 4 German.

TITLE: Production of hypernuclei by 8.8 Bev protons

PERIODICAL: Zhurnal eksperimental'noy i tekhnicheskoy fiziki, v. 44, no. 3,  
1963, 861-865

TEXT: This paper is the continuation of the work investigating the production of hypernuclei in photoemulsion exposed to the internal 8.8 Bev proton beam. The experimental procedure was described in an earlier paper by V. A. Tumanyan, M. G. Sarinyan, D. A. Galstyan, A. R. Kanetsyan, and M. Ye. Arustamova (Ref. 1: ZhETF 41, 1007, 1961). The results are summarized in Table 1 containing the first known cases of the  $B_A^{15}$  and  $B_A^{11}$  decays. The article concludes with a detailed discussion of the results on the basis of theoretical suggestions by P. Forrari and L. Fonda (Ref. 3: Nuovo Cim., 7, 520, 1958) and H. Primakoff and R. B. Chester (Ref. 4: Phys. Rev., 92, 1557, 1953). The physical results are in agreement with the conclusions of the first part of the Ref. 1. There are 3 figures and 2 tables.

TITLE: The use of an adaptable Gabor filter for the determination of the static characteristics of controlled objects

SOURCE: Avtomatyka, no. 5, 1965, 67-70

TOPIC TAGS: automatic control theory, adaptive control, polynomial, algorithm

ABSTRACT: In real object control there is a continuous need to know the static characteristics of the object under control. Such characteristics can be represented, in the first approximation, by polynomials and thus the problem reduces to the determination of the variable coefficients of such polynomials. The authors base their approach to the determination of control object characteristics on the use of the adaptable Gabor filters (D. Gabor et al., Proc. Inst. Electr. Engrs., No. 40, 1961), establish an appropriate detailed algorithm of the adaptable filter, and use it for the iterative solution of a simple and 2 figures.

Title : Influence of Micronutrients on Susceptibility of Sunflowers to Disease

Orig Pub : Dokl. Mosk. s.-kh. akad. im. K.A. Timiryazeva, 1957,  
vyp. 31, 144-151

Abstract : During 1955 (at Nenchinovka Station in Moskovskaya Oblast') and 1956 (at the training farm Cuchikhoz in Tambovskaya Oblast') a study was made of the influence of B and Mo separately and in combination with Cu on the susceptibility of the sunflower to diseases and on its harvest. Boron (effect and after-effect), applied as top-dressing accelerated the blossoming, decreased the number

of empty seeds, increased the seed yield 10 - 27%, and contributed toward increased resistance of the sunflower to rust, white and gray rot. Additional nutrition to the roots with B had only a negligible effect on the harvest and did not lessen the attack by diseases. Top-dressing with B in combination with Cu decreased susceptibility to diseases by 28% and increased the yield of seed by 20%. Mo in side and top dressing did not have any effect on increasing resistance of the sunflower to diseases nor on augmenting the harvest. -- G.A. D'yakova

"A Panoramic Attachment," R. Tymenskiy

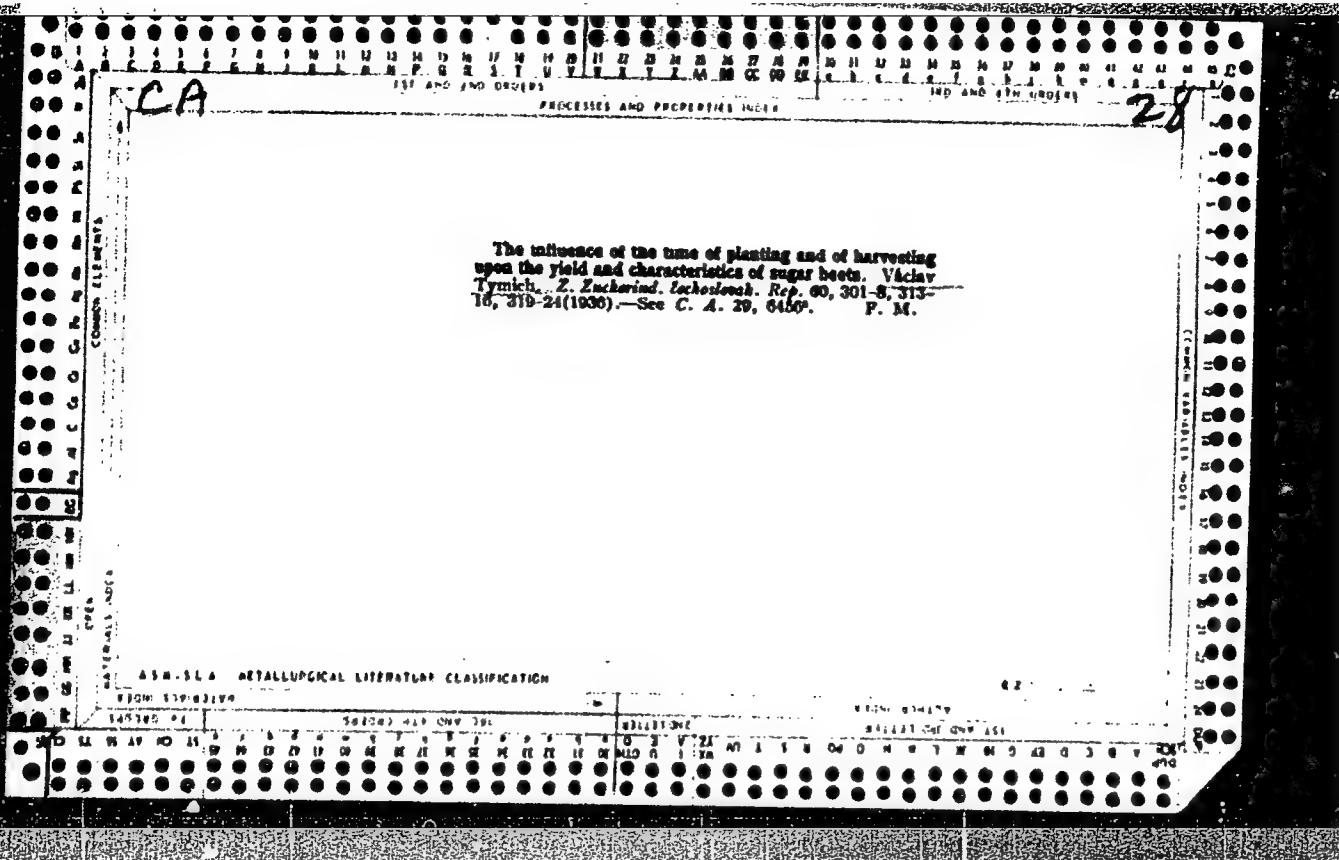

"Radio" No 6, pp 39-41

Describes panoramic attachment adaptable to any short-wave superhet with if of 460 kc, which permits observing, on a cathode-ray tube, signals from radio stations operating simultaneously on amateur bands, locating open channels, observing form of signals, watching calls and determining according to scale on tube the frequency on which desired station is operating. Also permits time observation of radio waves.

AUTHOR: Levinson, A. M.; Tyminskaya, S. Yu.

TITLE: Experiments on the cutting of stainless steel plates with thin diamond discs

CITED SOURCE: Sb. Bumagodel. mashinostroyeniye. Vyyp. 11. M.-L., 1963. 216-227

TOPIC TAGS: steel cutting, diamond cutter, diamond disc cutter

TRANSLATION: The authors describe experiments on the cutting of 0.2-0.5 mm wide grooves in Kh17, Kh17N2, and 1Kh18N9T stainless steel plates used in the papermaking industry with diamond cutting discs (DD). The experiments were performed on the 6N81G horizontal milling machine with a special head. It was found that the cutter best suited for grooves 0.35 mm wide and over have a grain size 80 and a concentration of 35-47%, while grooves less than 0.3 mm wide are best cut with discs with a grain size of 80-100 with a concentration of 35-45%. The following optimal regimes were established: cutting speed -- 50 mm/sec; feed

Card 1/2

ACCESSION NR: AR4027675

rate -- 65-125 mm/min depending on the disc thickness; vertical feed rate -- 8-30 mm/min. In comparison with milling, the groove machine time was reduced 3.5 times; the disc strength was 4 times higher than that of the milling machine cutter. An overall view of the experimental setup is included. 4 illustrations. Bibliography with 3 titles. G. Vil'ner.

III. Results of a study of high-efficiency  $^{235}\text{U}$  column packing for the separation of isotopes

WYDANIE I: Przemysł Chemiczny, v. 42, no. 3, 1965, 156-161

flow resistance during rectification, and dynamic <sup>or static</sup> air retention in dependence on feed rate and pressure were carried out. The data are tabulated, shown graphically, compared with other commercial column packings, such as Spraypak 34/22, Heli-grid, Raschig rings etc, and discussed theoretically. It is shown that polpak compares very favorably with the other packings: its efficiency (molar flow yield through theoretical plate) is very high and the

ability of a unit ...

4/14/55/2/27/3.1/003  
524/3307

flow resistance very low. This makes polyal particularly suitable for distillation under reduced pressure. Polyal may be used in both laboratory and industrial conditions and may be made of a wide range of materials. There are 12 figures and 4 tables.

Tymonki K. A Survey of House Building in the Light of the Reports  
of the Z. O. R. Authorities. (Institution for Workers' Settlements).  
Przegląd budownictwa mieszkaniowego w świetle sprawozdań  
dyrekcji technicznych Z. O. R." Architektura No 1, 1951, pp. 1-8. 14  
figs.

Main principles of the policy of the State as investor in house  
building for the working population. Main features of the building  
movement immediately after the war. The principles of reconstruc-  
tion implemented by Z.O.R. (Institution for Workers' Settlements).  
The reconstruction of Warsaw, the capital of Poland, as adapted to  
the requirements of the socialist building scheme. Specific conditions  
and problems of house building in particular districts and towns of  
Poland. Change in the former professional and social structure of  
Polish urban areas effected by housing the working population in the  
centre of the town. Principles applied in the reconstruction of his-  
toric towns: preservation of features of the old architecture and of  
the old architectural plan in the centre of a town and imparting  
modern forms to the outskirts. Exploration of new aspects for Po-  
land towns contacts with the USSR. Mechanisation of the building  
work. The use of pre-fabricated, high-speed and line production.  
Occupants' opinions about houses newly built by Z.O.R. (Institution  
for Workers' Settlements).
